

Hints Chapter 3

Learn C With Babbo

You can use integer division and the modulo (%) operator to get the total of the largest denomination and the remaining amount. For example, `736 / 100` gives 7, for 7 dollars, and `736 % 100` gives 36, for the remaining 36 cents. But the modulo operator and integer division will only work on integers, and the dollar amount is entered as a floating-point number. Can you think of a way to convert it to an integer using the example I just gave?
